Organization

Nevada Partners, a government-funded organization focused on improving the outcomes of high school students with historically poor results, had won a grant from the Nevada government. Their goal was to equip these students with the necessary skills for high-demand tech jobs. However, they faced significant challenges in delivering effective education and tracking student engagement.

The Challenge

Nevada Partners aimed to scale their reach through online education, but they struggled with low and untrackable engagement levels. They also wanted to motivate students through novelty and gamification but lacked a platform that could provide granular data to convert into reward tokens for students.

From the coaching standpoint that's where the Ahura data gets very exciting. To really look at those data points and start structuring and coaching and guiding the learner, to get to that sweet spot where, you know, I can push you to that next level.
